Someone... was beaming powerful wireless pulses into the theatre and they were strong enough to interfere with the projector's electric arc discharge lamp. Mentally decoding the missive, [Fleming's assistant Arthur] Blok realised it was spelling one facetious word, over and over: "Rats". A glance at the output of the nearby Morse printer confirmed this. The incoming Morse then got more personal, mocking Marconi: "There was a young fellow of Italy, who diddled the public quite prettily," it trilled. Further rude epithets - apposite lines from Shakespeare - followed.

Internet in a nutshell...

You want to connect two machines (desktops, laptops, mobile devices, routers, embedded devices, ...)

A “hop”

A “hop”

(even Ethernet is broadcast)

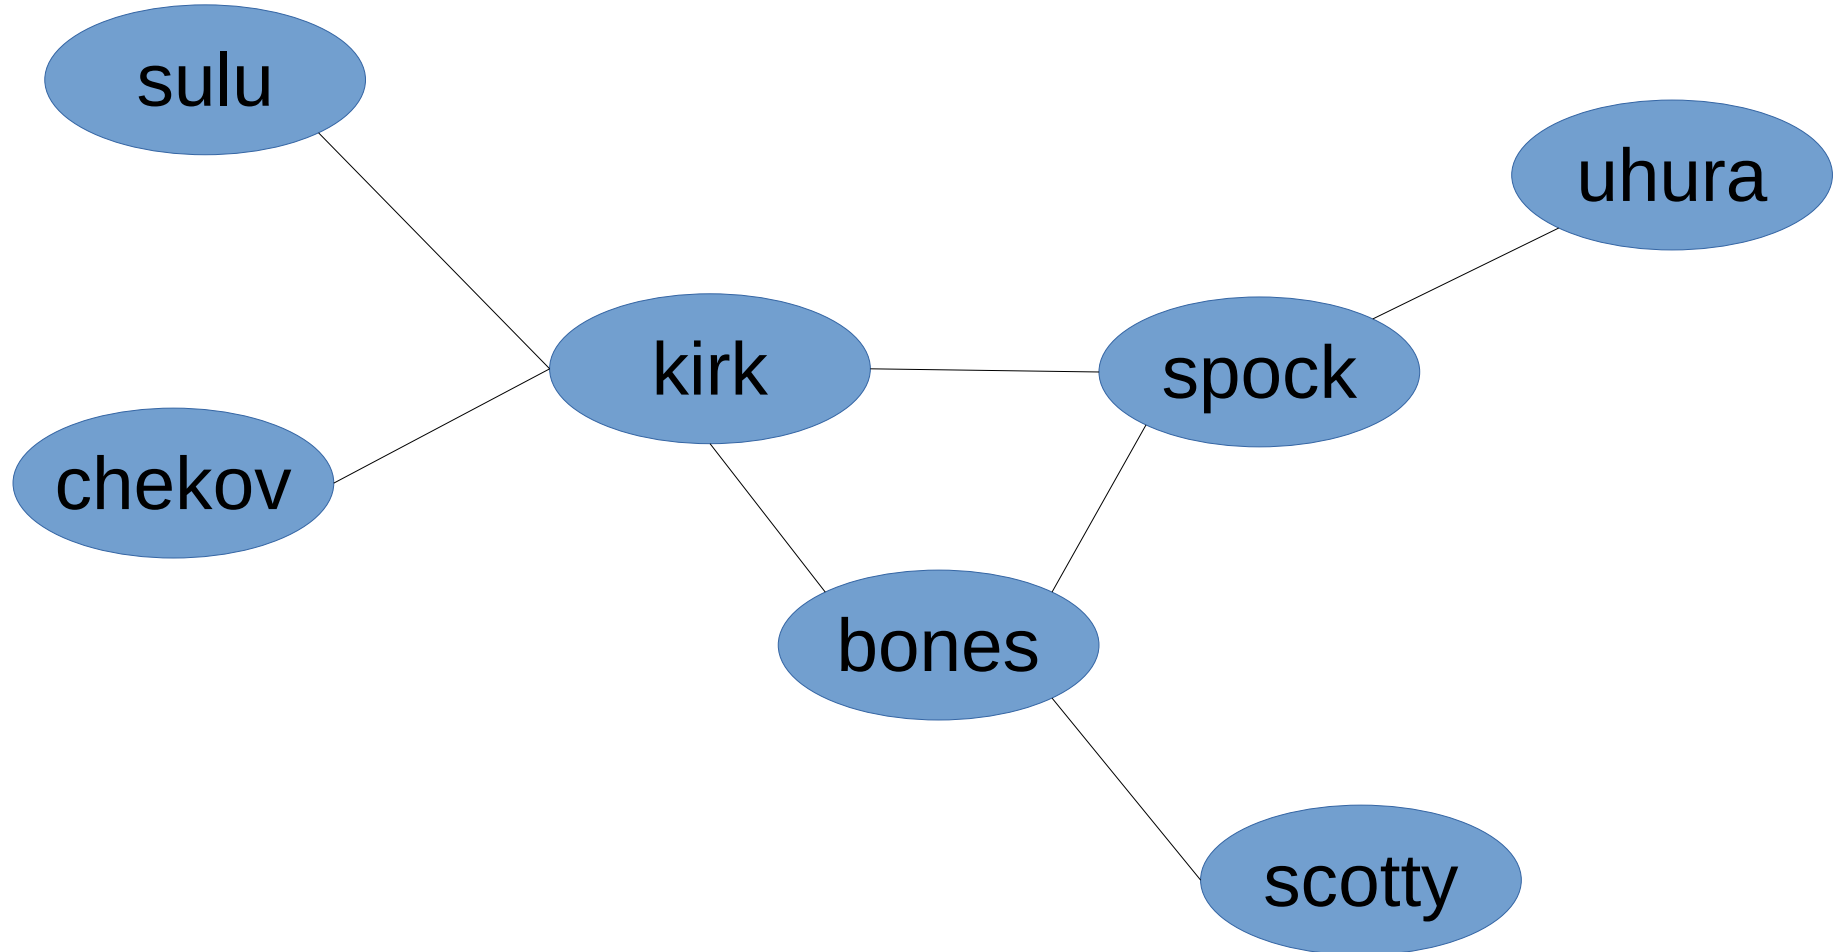

A “subnet”

A “subnet”

ARP = Address Resolution Protocol

A network with routers

More terminology

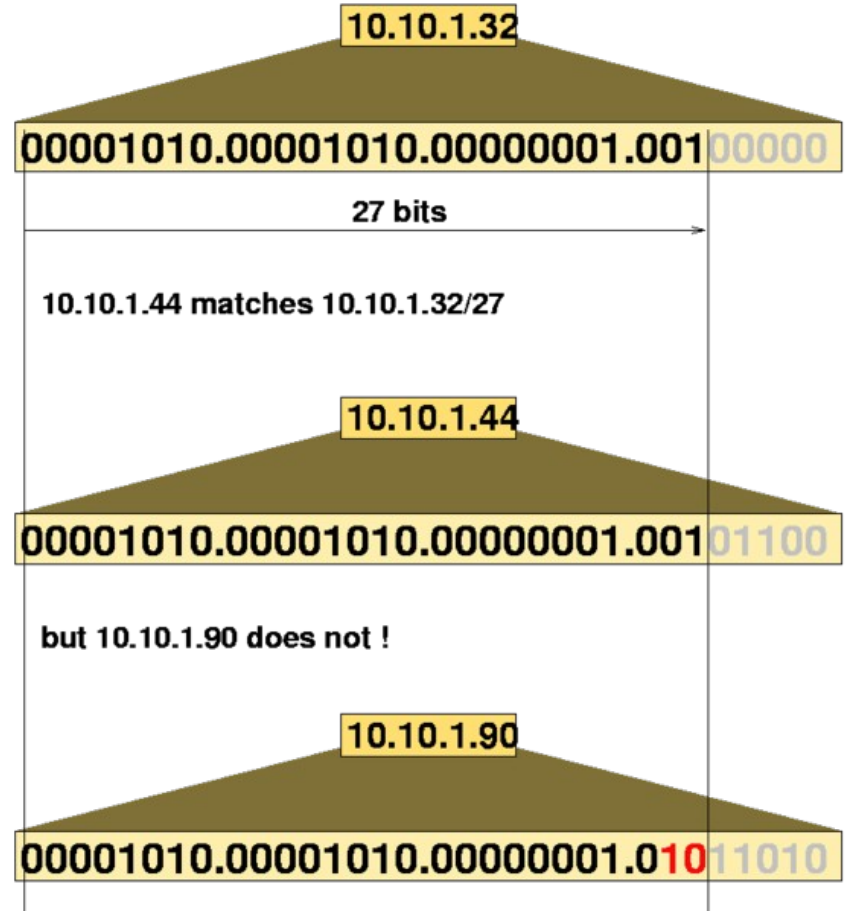

- IP = Internet protocol
- Forwarding, or “routing”
 - How packets get across the network
- Interface
 - WiFi, cellular, ...
- Path (or “route”), reverse path

IP address

- IPv4 is 32-bits, broken into 4 bytes
 - 192.168.7.8
 - 64.106.46.20
 - 8.8.8.8
- IPv6 is 128 bits
 - 2001:0db8:85a3:0000:0000:8a2e:0370:7334

CIDR

- Classless Inter-Domain Routing
- /27 has a net mask of 255.255.255.224

A connection

- For now, just know TCP, UDP, and ICMP
 - Stream sockets vs. datagrams
- TCP and UDP have “ports”
 - Port helps identify a process for incoming packets
 - Open port == “listening”
- Three-way handshake

Process?

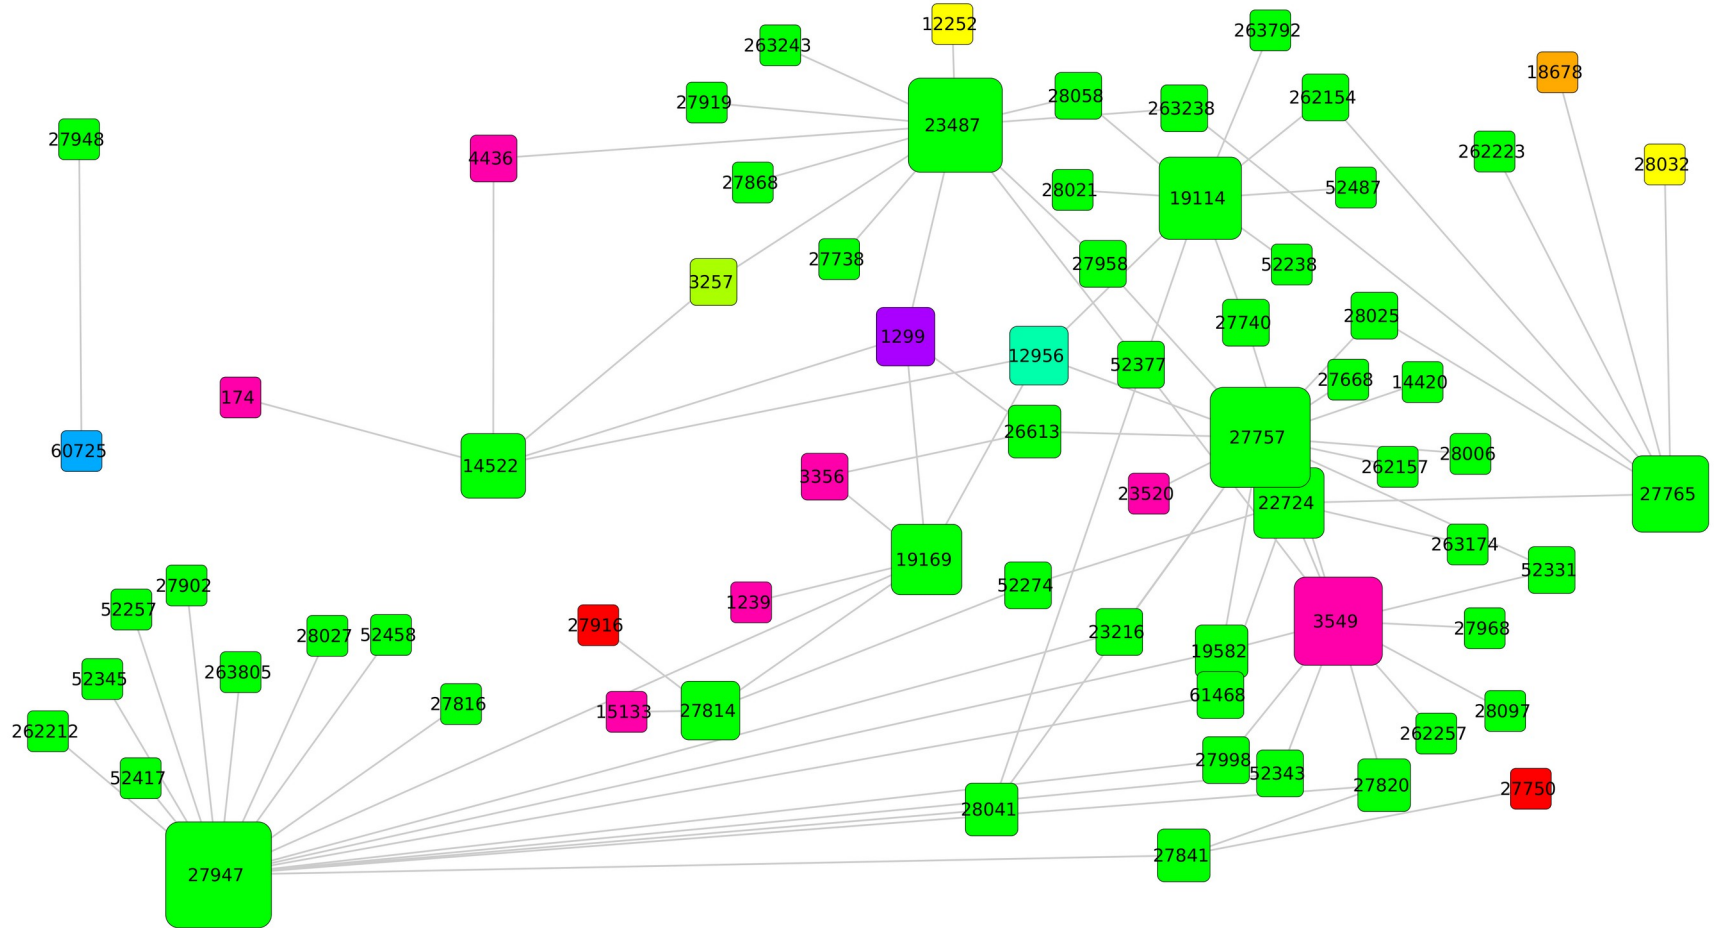

Separated by virtual memory, access system resources *via* system calls.

Almost there...

- DNS for resolving hostnames to IPs
 - breakpointingbad.com becomes 149.28.240.117
- BGP to scale to the size of the Internet
 - Path vector protocol
- HTTP as another example of an application layer protocol

Internet in Ecuador...

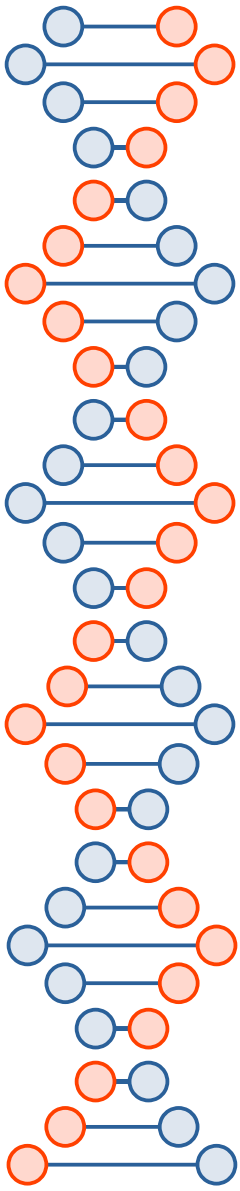

OSI model

- 1. Physical
- 2. Link
- 3. Network
- 4. Transport
- 5. Session
- 6. Presentation
- 7. Application

Why do we need crypto?

- Potential adversaries at every hop
 - Confidentiality of messages
 - (Crypto doesn't hide the message's existence, that's steganography)
 - Integrity of messages
 - If a bit gets changed in transit, we'd like to know
 - Authenticity
 - Who actually sent the message?

Other properties we might like (preview)...

- Key exchange
- Non-repudiation
- Forward secrecy
- Off-the-record
 - Malleability, plausible deniability
- Future secrecy

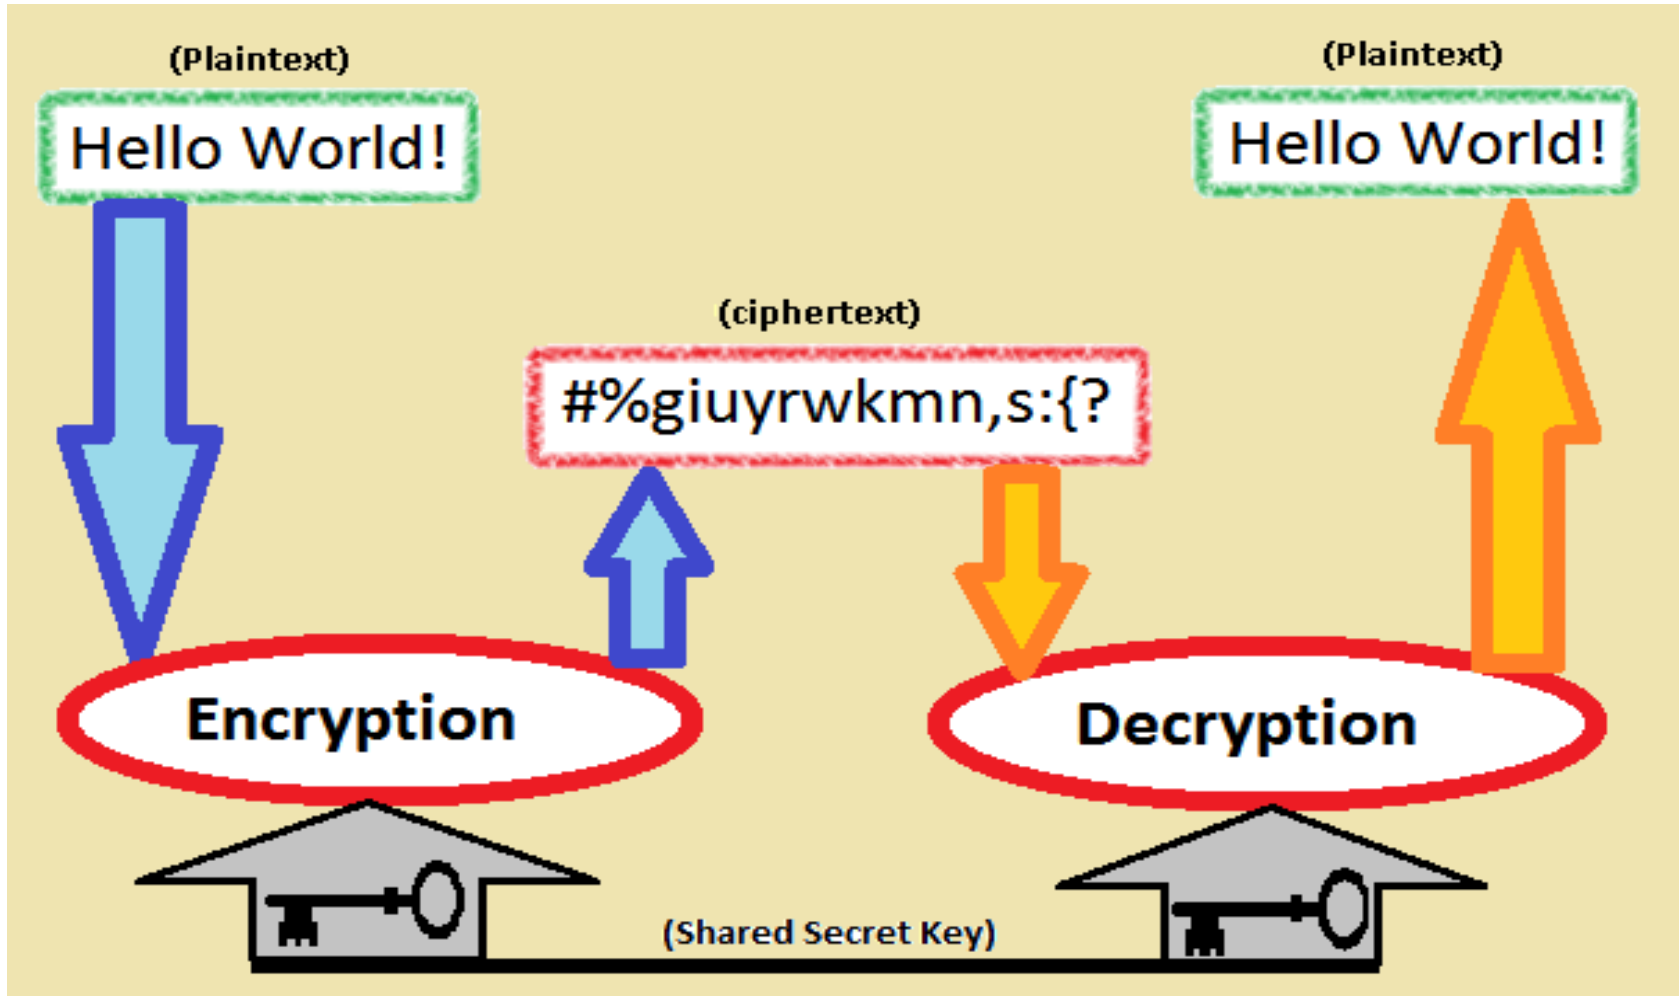

Overview

- Symmetric encryption
 - Assumes two parties wishing to communicate already have a shared secret
- Asymmetric encryption
 - Makes different assumptions (e.g., that everybody knows the public key or that the eavesdropper is passive)
 - Quantum computers break current algorithms that are used in practice
- Secure hash functions and message authentication

Symmetric Crypto

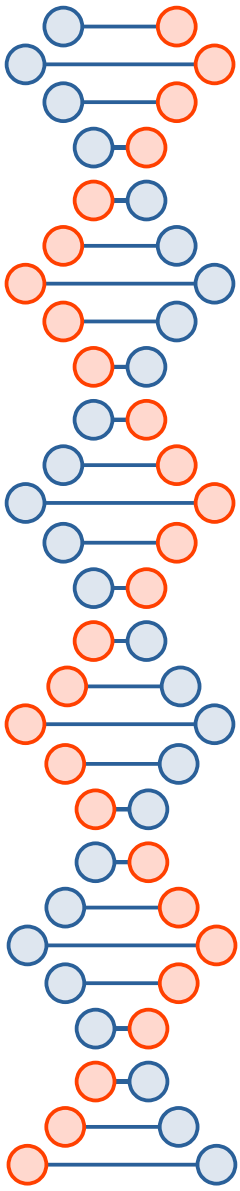

- Confidentiality
- Integrity
- ~~Availability~~
- Authentication
- ~~Non-repudiation~~
- ~~A way to distribute the shared secret keys~~

Source: Wikipedia

Terminology

- Plaintext – before encryption, easy to read
- Ciphertext – after encryption, hopefully indecipherable without the key
- Key – the shared secret, typically just bits that were generated with a high entropy process

Review on your own...

- Caesar Cipher
- Vigenere Cipher and related attacks

Modern symmetric crypto

- Mostly:
 - Substitution
 - Permutation
 - XOR

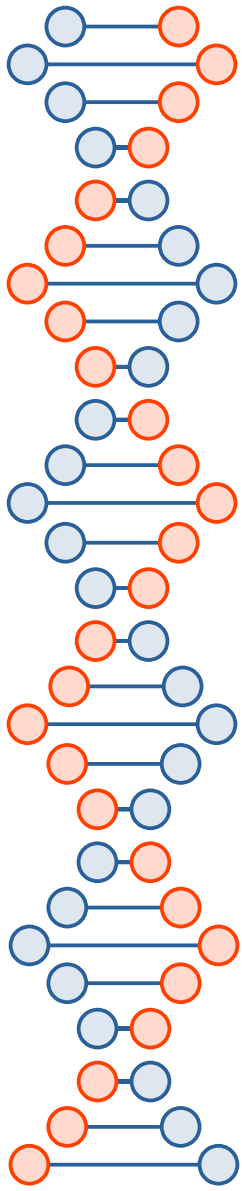

Substitution

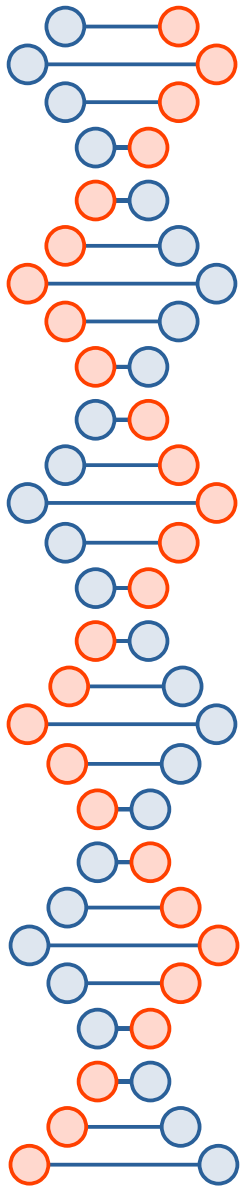

HELLO WORLD

TNWWX DXPWE

Permutation

| | | | | | |
|------|------|------|------|------|------|
| ABCD | ABDC | ACBD | ACDB | ADBC | ADCB |
| BACD | BADC | BCAD | BCDA | BDAC | BDCA |
| CABD | CADB | CBAD | CBDA | CDAB | CDBA |
| DABC | DACB | DBAC | DBCA | DCAB | DCBA |

Bitwise XOR

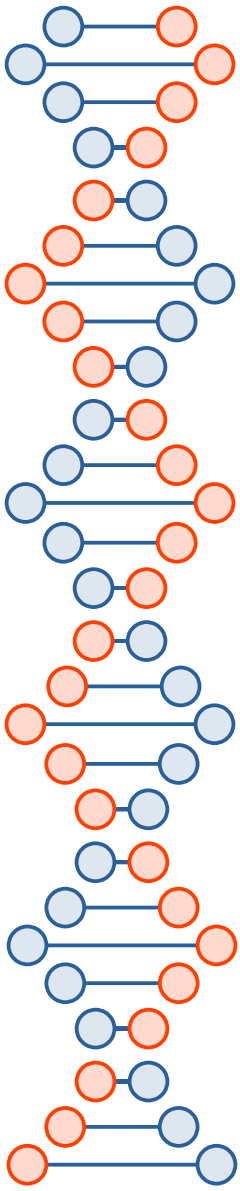

$$\begin{aligned} & 00101010_b \\ \oplus & 10000110_b \\ = & 10101100_b \end{aligned}$$

2000+ years of history...

Symmetric encryption over time

- Handwritten notes, *etc.* for centuries
 - Typically the algorithm was secret
- 1883 ... Kerckhoff's rules
 - Now we know the key should be the only secret
- 1975 ... DES
 - Efficient in hardware, not in software
- 2001 ... AES
 - Efficient in software, and lots of different kinds of hardware

William and Elizabeth Friedman

- Met while analyzing Shakespeare ciphers at Riverbank Laboratories (“William Friedman wrote Shakespeare's plays”)
- Elizabeth solved ciphers of alcohol and drug smugglers, then German ambassadors in South America (three enigma machines)
- William led a team that solved PURPLE, conceived CryptoAG scheme

https://en.wikipedia.org/wiki/Type_B_Cipher_Machine#/media/File:Purple_cipher_machine_analog_bw_photo_NCM.jpg

[https://en.wikipedia.org/wiki/Enigma_machine#/media/File:Enigma_\(crittografia\)_-_Museo_scienza_e_tecnologia_Milano.jpg](https://en.wikipedia.org/wiki/Enigma_machine#/media/File:Enigma_(crittografia)_-_Museo_scienza_e_tecnologia_Milano.jpg)

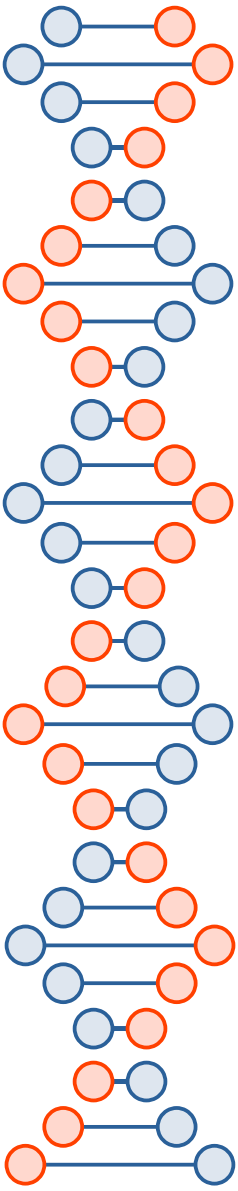

Zodiac cipher

Image from wikia

Bitwise XOR as a cipher itself

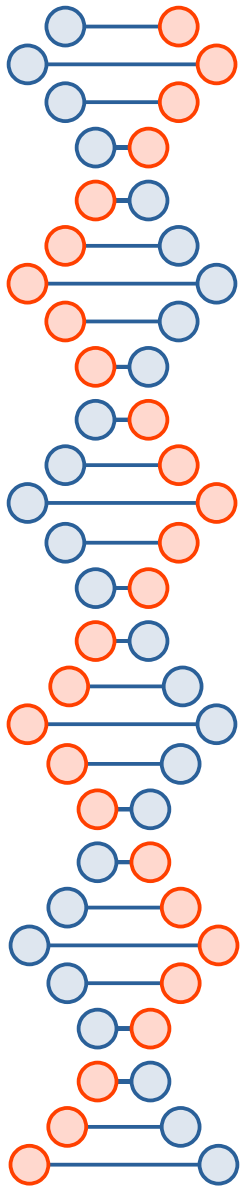

- Typically used by malware, 8 or 32 bits
 - WEP attack uses these properties
- $(B \text{ xor } K) \text{ xor } K = B$
- $(A \text{ xor } K) \text{ xor } (B \text{ xor } K) = A \text{ xor } B$
- $(0 \text{ xor } K) = K$
- $(K \text{ xor } K) = 0$
- Frequency analysis or brute force

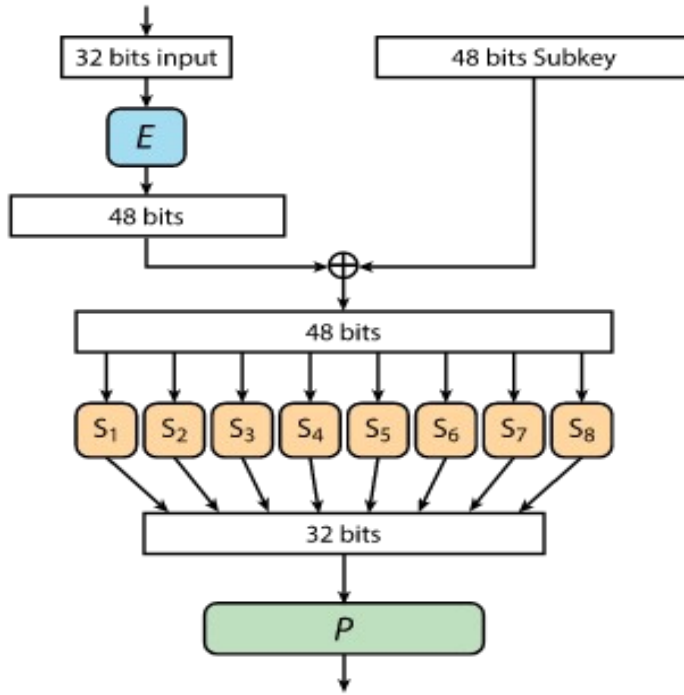

One-time pad

- *E.g.*, an XOR cipher or Caesar cipher where the key has good randomness and is as long as the plaintext
 - And never gets reused
- Most codes made by the NSA through the 1980s were one-time pads
 - What if it's not practical to share enough key material beforehand, *e.g.*, on the Internet?

1977 - DES (16 rounds, 64-bit blocks, 56-bit key)

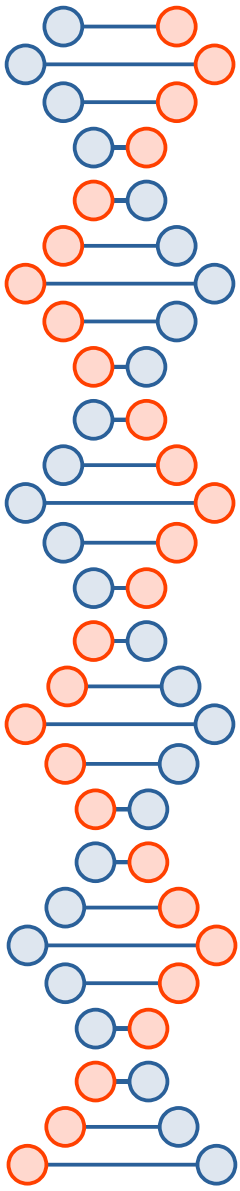

DES S-boxes

- 6 bits becomes 4 bits
- Somewhat arbitrary
 - IBM proposed some, NSA replaced with others

Importance of substitution

- XOR and permutation are linear functions
 - Solve for the key given plaintext and ciphertext?
- Bit differences in inputs are not changed at all by permuting bits
- XOR also preserves differences in bits

Different approaches (preview)

- DES simply tried to thwart these two specific types of attack (linear and differential) by carefully choosing the S boxes and letting them destroy information about the input (okay because of Feistel structure)
- AES is going to do something a lot more clever, that is invertible (no need for the Feistel structure, so fewer rounds) but still thwarts linear and differential cryptanalysis.

Cryptography Engineering by Ferguson *et al.*

Preparation for next lecture...

You have 12 coins, one is counterfeit. The counterfeit is either slightly heavier or slightly lighter, otherwise it's impossible to tell. You have a balance. Using the balance the fewest number of times, find the counterfeit coin.
