

# AES and cipherblock chaining modes

CSE 468 Fall 2024  
jedimaestro@asu.edu

# Why study AES?

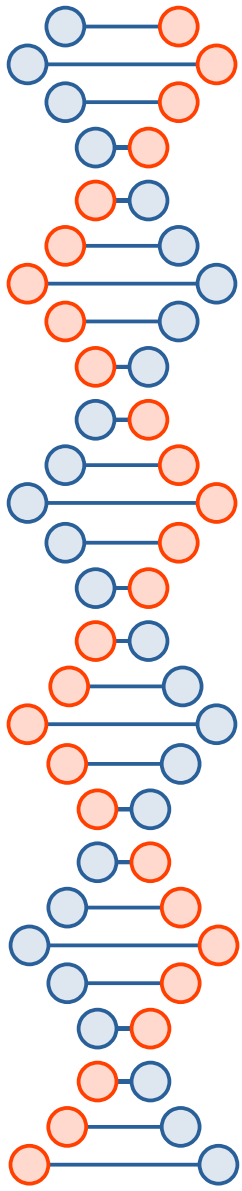

- It's a good demonstration of principles we'll be talking about (*e.g.*, confusion and diffusion).
- It's the workhorse of the majority of network crypto, *e.g.*, TLS
- It's easy to see that AES is just substitution, permutation, and XOR

## Substitution

HELLO WORLD

TNWWX DXPWE

## Permutation

ABCD

ABDC

ACBD

ACDB

ADBC

ADCB

BACD

BADC

BCAD

DBCA

DCAB

DCBA

## Bitwise XOR

$$\begin{aligned} & 00101010_b \\ \oplus & 10000110_b \\ = & 10101100_b \end{aligned}$$

# Symmetric encryption over time (review)

- Handwritten notes, *etc.* for centuries
  - Typically the algorithm was secret
- 1883 ... Kerckhoff's rules
  - Now we know the key should be the only secret
- 1975 ... DES
  - Efficient in hardware, not in software
- 2001 ... AES
  - Efficient in software, and lots of different kinds of hardware

# Substitution Permutation Network

e.g., AES 128-bit blocks, (128-, 192-, 256-)bit key, (10, 12, 14) rounds

# AES

- Rijndael
  - Joan Daemen and Vincent Rijmen
- Very clever S-box design that comes from Kaisa Nyberg
  - Based on finite fields (*a.k.a.* Gallois fields)

# Finite fields

- In computer science, we like to pack things into the natural numbers between 0 and  $2^n - 1$
- Would also be nice if things wrapped around and had other nice mathematical properties so we could pretend we didn't have this limitation
- *Really* nice if we don't waste any of the state space, *i.e.*, we use everything from 0 through  $2^n - 1$

[https://en.wikipedia.org/wiki/%C3%89variste\\_Galois](https://en.wikipedia.org/wiki/%C3%89variste_Galois)

[https://en.wikipedia.org/wiki/Quadratic\\_equation](https://en.wikipedia.org/wiki/Quadratic_equation)

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

[https://en.wikipedia.org/wiki/Cubic\\_equation](https://en.wikipedia.org/wiki/Cubic_equation)

$$\frac{a}{q}x^2 + \frac{bq + ap}{q^2}x + \frac{cq^2 + bpq + ap^2}{q^3}$$

# What is a field?

- “In mathematics, a field is a set on which addition, subtraction, multiplication, and division are defined and behave as the corresponding operations on rational and real numbers do.”
  - Wikipedia
- In cryptography, we often want to “undo things” or get the same result two different ways
  - Math!
- On digital computers the math you learned in grade school is not good enough
  - Suppose we want to multiply by a plaintext, and the plaintext is 3. Great!
  - Now the decryption needs the inverse operation. Crap!
  - $1/3$  is not easy to deal with (not even in floating point or fixed point)

# Field

- Commutative

$$a + b = b + a$$

$$a * b = b * a$$

- Associative

$$(a + b) + c = a + (b + c)$$

$$(a * b) * c = a * (b * c)$$

- Identity

$$0 \neq 1, a + 0 = a, a * 1 = a$$

- Inverse

$$a + -a = 0$$

$$a * a^{-1} = 1$$

- Distributive

$$a * (b + c) = (a * b) + (a * c)$$

# Integers mod 100

- Commutative? Associative? Identity?
- Inverse?

# Integers mod 100

- Commutative? Associative? Identity?
- ~~Inverse?~~
  - Sometimes there is one, e.g., 3 and 67 ( $201 \% 100 = 1$ )
  - Sometimes not, e.g., 5
  - Integers mod 100 is **not** a finite field!

# Integers mod 101

- Commutative? Associative? Identity?
- Inverse?
  - Every number  $0 < i < 101$  has a multiplicative inverse
    - Co-prime to 101, because 101 is prime
  - Integers mod 101 **is** a finite field!
    - True of any prime number
    - In general  $p^k$  where  $p$  is prime and  $k$  is positive integer

# GF(2)

- Want to define a field over  $2^k$  possibilities for a k-bit number
- 2 is prime, all other powers of 2 are not
  - Need to use irreducible polynomials

**Mini Advanced Encryption Standard  
(Mini-AES):  
A Testbed for Cryptanalysis Students**

Raphael Chung-Wei **Phan**

## 2.1 The Finite Field $GF(2^4)$

The nibbles of Mini-AES can be thought of as elements in the finite field  $GF(2^4)$ . Finite fields have the special property that operations (+, -,  $\times$  and  $\div$ ) on the field elements always cause the result to be also in the field. Consider a nibble  $n = (n_3, n_2, n_1, n_0)$  where  $n_i \in \{0,1\}$ . Then, this nibble can be represented as a polynomial with binary coefficients i.e having values in the set  $\{0,1\}$ :

$$n = n_3 x^3 + n_2 x^2 + n_1 x + n_0$$

### *Example 1*

Given a nibble,  $n = 1011$ , then this can be represented as

$$n = 1 x^3 + 0 x^2 + 1 x + 1 = x^3 + x + 1$$

Note that when an element of  $GF(2^4)$  is represented in polynomial form, the resulting polynomial would have a degree of at most 3.

## 2.2 Addition in $GF(2^4)$

When we represent elements of  $GF(2^4)$  as polynomials with coefficients in  $\{0,1\}$ , then addition of two such elements is simply addition of the coefficients of the two polynomials. Since the coefficients have values in  $\{0,1\}$ , then the addition of the coefficients is just modulo 2 addition or exclusive-OR denoted by the symbol  $\oplus$ . Hence, for the rest of this paper, the symbols  $+$  and  $\oplus$  are used interchangeably to denote addition of two elements in  $GF(2^4)$ .

### *Example 2*

Given two nibbles,  $n = 1011$  and  $m = 0111$ , then the sum,  $n + m = 1011 + 0111 = 1100$  or in polynomial notation:

$$n + m = (x^3 + x + 1) + (x^2 + x + 1) = x^3 + x^2$$

## 2.3 Multiplication in $GF(2^4)$

Multiplication of two elements of  $GF(2^4)$  can be done by simply multiplying the two polynomials. However, the product would be a polynomial with a degree possibly higher than 3.

### *Example 3*

Given two nibbles,  $n = 1011$  and  $m = 0111$ , then the product is:

$$\begin{aligned}(x^3 + x + 1)(x^2 + x + 1) &= x^5 + x^4 + x^3 + x^3 + x^2 + x + x^2 + x + 1 \\ &= x^5 + x^4 + 1\end{aligned}$$

In order to ensure that the result of the multiplication is still within the field  $GF(2^4)$ , it must be reduced by division with an irreducible polynomial of degree 4, the remainder of which will be taken as the final result. An irreducible polynomial is analogous to a prime number in arithmetic, and as such a polynomial is irreducible if it has no divisors other than 1 and itself. There are many such irreducible polynomials, but for Mini-AES, it is chosen to be:

$$m(x) = x^4 + x + 1$$

#### Example 4

Given two nibbles,  $n = 1011$  and  $m = 0111$ , then the final result after multiplication in  $GF(2^4)$ , called the 'product of  $n \times m$  modulo  $m(x)$ ' and denoted as  $\otimes$ , is:

$$\begin{aligned}(x^3 + x + 1) \otimes (x^2 + x + 1) &= x^5 + x^4 + 1 \text{ modulo } x^4 + x + 1 \\ &= x^2\end{aligned}$$

This is because:

$$\begin{array}{r} \phantom{x^4 + x + 1} \overline{) x^5 + x^4 + 1} \qquad \text{(quotient)} \\ + x^5 + x^2 + x \\ \hline \phantom{x^4 + x + 1} \phantom{) } x^4 + x^2 + x + 1 \\ + \phantom{x^4 + x + 1} x^4 + \phantom{x^2 + x + 1} x + 1 \\ \hline \phantom{x^4 + x + 1} \phantom{) } \phantom{x^4 + } x^2 \qquad \text{(remainder)} \end{array}$$

Note that since the coefficients of the polynomials are in  $\{0,1\}$ , then addition is simply exclusive-OR and hence subtraction is also exclusive-OR since exclusive-OR is its own inverse.

# An alternative to AES: Tiny Encryption Algorithm (TEA), Feistel structure with 32 rounds

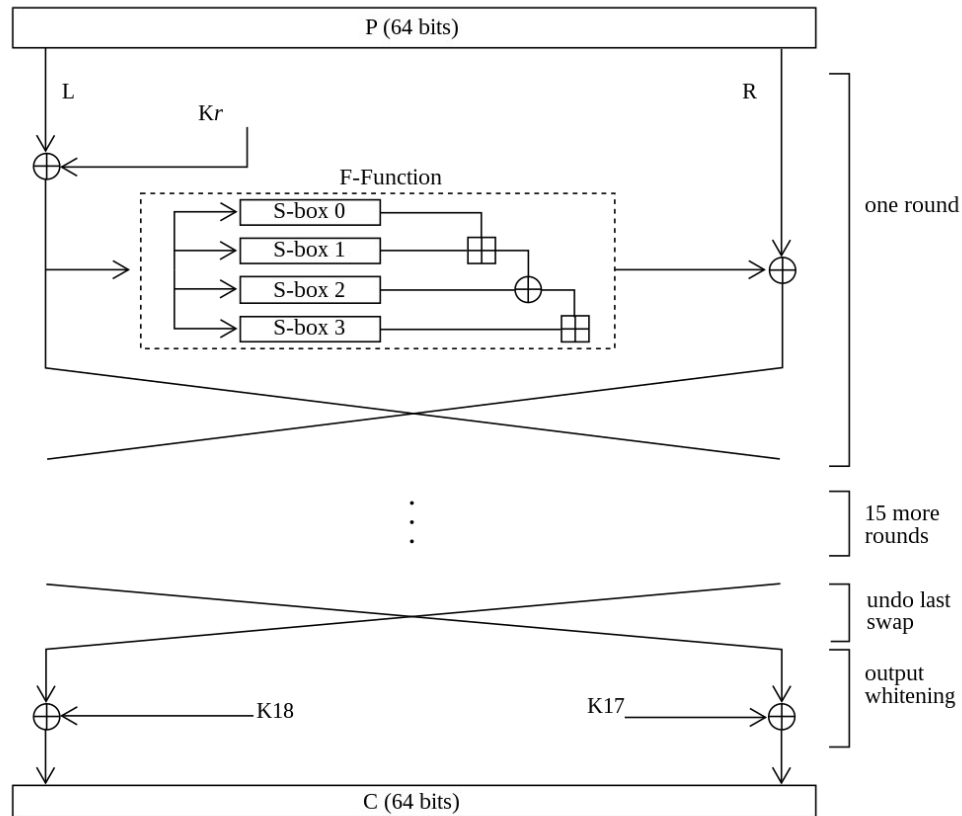

```
#include <stdint.h>

void encrypt (uint32_t v[2], const uint32_t k[4]) {
    uint32_t v0=v[0], v1=v[1], sum=0, i;          /* set up */
    uint32_t delta=0x9E3779B9;                    /* a key schedule constant */
    uint32_t k0=k[0], k1=k[1], k2=k[2], k3=k[3]; /* cache key */
    for (i=0; i<32; i++) {                        /* basic cycle start */
        sum += delta;
        v0 += ((v1<<4) + k0) ^ (v1 + sum) ^ ((v1>>5) + k1);
        v1 += ((v0<<4) + k2) ^ (v0 + sum) ^ ((v0>>5) + k3);
    }                                              /* end cycle */
    v[0]=v0; v[1]=v1;
}

void decrypt (uint32_t v[2], const uint32_t k[4]) {
    uint32_t v0=v[0], v1=v[1], sum=0xC6EF3720, i; /* set up; sum is (delta << 5) & 0xFFFFFFFF */
    uint32_t delta=0x9E3779B9;                    /* a key schedule constant */
    uint32_t k0=k[0], k1=k[1], k2=k[2], k3=k[3]; /* cache key */
    for (i=0; i<32; i++) {                        /* basic cycle start */
        v1 -= ((v0<<4) + k2) ^ (v0 + sum) ^ ((v0>>5) + k3);
        v0 -= ((v1<<4) + k0) ^ (v1 + sum) ^ ((v1>>5) + k1);
        sum -= delta;
    }                                              /* end cycle */
    v[0]=v0; v[1]=v1;
}
```

# Another alternative to AES: Blowfish (Twofish was in the AES competition)

[https://en.wikipedia.org/wiki/Blowfish\\_\(cipher\)](https://en.wikipedia.org/wiki/Blowfish_(cipher))

P=Plaintext; C=Ciphertext;  $K_x$  = P-array-entry  $x$   
 $\oplus$  = xor       $\boxplus$  = addition mod  $2^{32}$

# AES S-box requirements

- Can't pull it out of our &# like the NSA did for DES
- Should have good nonlinear properties
  - Better nonlinearity means fewer rounds
- Should be reversible
  - Don't want to use a Feistel structure for performance reasons

[https://en.wikipedia.org/wiki/Kaisa\\_Nyberg](https://en.wikipedia.org/wiki/Kaisa_Nyberg)

The MixColumns operation also uses Galois fields  
(but is a linear function)...

```

1 private byte GMul(byte a, byte b) { // Galois Field (256) Multiplication of two Bytes
2     byte p = 0;
3
4     for (int counter = 0; counter < 8; counter++) {
5         if ((b & 1) != 0) {
6             p ^= a;
7         }
8
9         bool hi_bit_set = (a & 0x80) != 0;
10        a <<= 1;
11        if (hi_bit_set) {
12            a ^= 0x1B; /* x^8 + x^4 + x^3 + x + 1 */
13        }
14        b >>= 1;
15    }
16
17    return p;
18 }
19
20 private void MixColumns() { // 's' is the main State matrix, 'ss' is a temp matrix of the same dimensions
21     as 's'.
22     Array.Clear(ss, 0, ss.Length);
23
24     for (int c = 0; c < 4; c++) {
25         ss[0, c] = (byte)(GMul(0x02, s[0, c]) ^ GMul(0x03, s[1, c]) ^ s[2, c] ^ s[3, c]);
26         ss[1, c] = (byte)(s[0, c] ^ GMul(0x02, s[1, c]) ^ GMul(0x03, s[2, c]) ^ s[3, c]);
27         ss[2, c] = (byte)(s[0, c] ^ s[1, c] ^ GMul(0x02, s[2, c]) ^ GMul(0x03, s[3, c]));
28         ss[3, c] = (byte)(GMul(0x03, s[0, c]) ^ s[1, c] ^ s[2, c] ^ GMul(0x02, s[3, c]));
29     }
30
31     ss.CopyTo(s, 0);
32 }

```

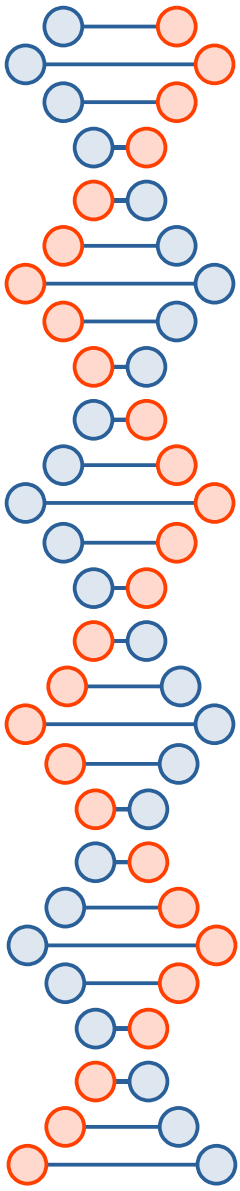

[https://en.wikipedia.org/wiki/Rijndael\\_MixColumns](https://en.wikipedia.org/wiki/Rijndael_MixColumns)

# AES

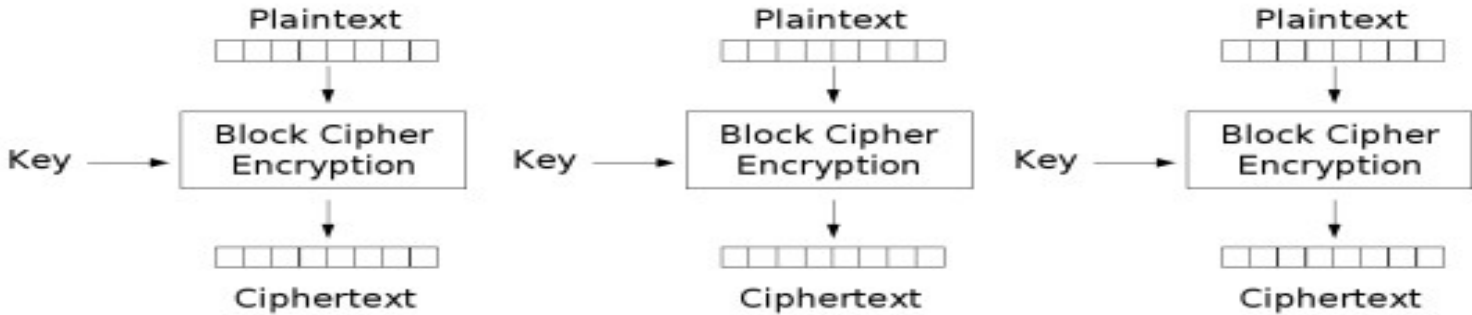

- 128-bit blocks, 128-, 192-, or 256-bit keys
  - 10, 12, or 14 rounds respectively
- No less secure than the other candidates, but better performance...
  - In hardware *and* software
    - Different word sizes (8, 16, 32, 64)
  - With or without specialized hardware support
    - *E.g.*, Gallois Fields on Blackfin DSPs
    - *E.g.*, AES special instruction set on Intel chips

# Cipher modes

- ECB, CBC discussed in the next slides
- Also Counter Mode, Galois Counter Mode, Cipher Feedback, Output Feedback, more...
  - Parallelization, message authentication, and other features
  - Can make stream ciphers out of block ciphers

# Electronic Codebook (ECB)

Electronic Codebook (ECB) mode encryption

# *Cryptography Engineering* by Ferguson *et al.*

We want to formalize confusion and diffusion.  
For this and other things coming later in the semester, we need to study information theory..

# A puzzle...

You have 12 coins, one is counterfeit. The counterfeit is either slightly heavier or slightly lighter, otherwise it's impossible to tell. You have a balance. Using the balance the fewest number of times, find the counterfeit coin.
