Interprocess Communication (IPC)

- Sockets
 - Datagram or stream
- Pipes
 - Named or unnamed
- Other ways for processes to communicate
 - Command line arguments, shared memory, file I/O, *etc.*

```
jedi@sugarpine:~$ mkfifo /tmp/myunnamedpipe
```

```
jedi@sugarpine:~$ cat messages.txt
```

```
Hello, how are you?
```

```
I am fine.
```

```
Goodbye.
```

```
jedi@sugarpine:~$ cat messages.txt > /tmp/myunnamedpipe &
```

```
[1] 877804
```

```
jedi@sugarpine:~$ cat /tmp/myunnamedpipe | while read line; do bash -c "echo $line"; done
```

```
Hello, how are you?
```

```
I am fine.
```

```
Goodbye.
```

```
[1]+ Done
```

```
cat messages.txt > /tmp/myunnamedpipe
```

```
jedi@sugarpine:~$
```

Filesystem

```

```

File permissions

```
crandall@hannibal: ~  
crandall@rubicon ~ $ sudo grep "hal" /etc/passwd  
hal:x:1003:1003:Hal,,,:/home/hal:/bin/bash  
crandall@rubicon ~ $ sudo grep "hal" /etc/shadow  
hal:$6$4asLz5vU$l5FDnfwLtlXQf/EESsxI3f3YbjM3fzTtw9EwKy8vsnEU4e8uKIvoy0ST99nquwH5  
QrHwt3SvGsciQk2D980Q9.:17259:0:99999:7:::  
crandall@rubicon ~ $ ls -l /etc/passwd  
-rw-r--r-- 1 root root 2021 Apr  2 22:49 /etc/passwd  
crandall@rubicon ~ $ ls -l /etc/shadow  
-rw-r----- 1 root shadow 1532 Apr  2 22:49 /etc/shadow  
crandall@rubicon ~ $
```

`-rwxr-x---`

- First is special designations (symlink, directory)
- Next triplet is user (u)
- Triplet after is group (g)
- Last triplet is others (o)
- r = read, w = write, x = execute
- Sometimes you'll see other things, like s for Set UID

Authentication in general

- Bishop, *Computer Security: Art and Science...*
“Authentication is the binding of an identity to a principal. Network-based authentication mechanisms require a principal to authenticate to a single system, either local or remote. The authentication is then propagated.”

Authentication in general (continued)

- Bishop: “Authentication consists of an entity, the *user*, trying to convince a different entity, the *verifier*, of the user's identity. The user does so by claiming to know some information, to possess something, to have some particular set of physical characteristics, or to be in a specific location.”
- Informally: something you know, something you have, something you are

2FA = 2-Factor Authentication

- Two of these:
 - Something you know
 - Something you have
 - Something you are
- *E.g.*, bank card plus PIN
- For Internet services, typically the first two
- Helps protect against phishing, for example

Basic Linux authentication

- Ties you (the identity) to your user ID (the principal), which is in turn tied to subjects (*e.g.*, processes) and objects (*e.g.*, files)
- Based on hashing
 - Also salting
 - Also shadowed password hashes

password

username

/etc/passwd

/etc/shadow

Salt

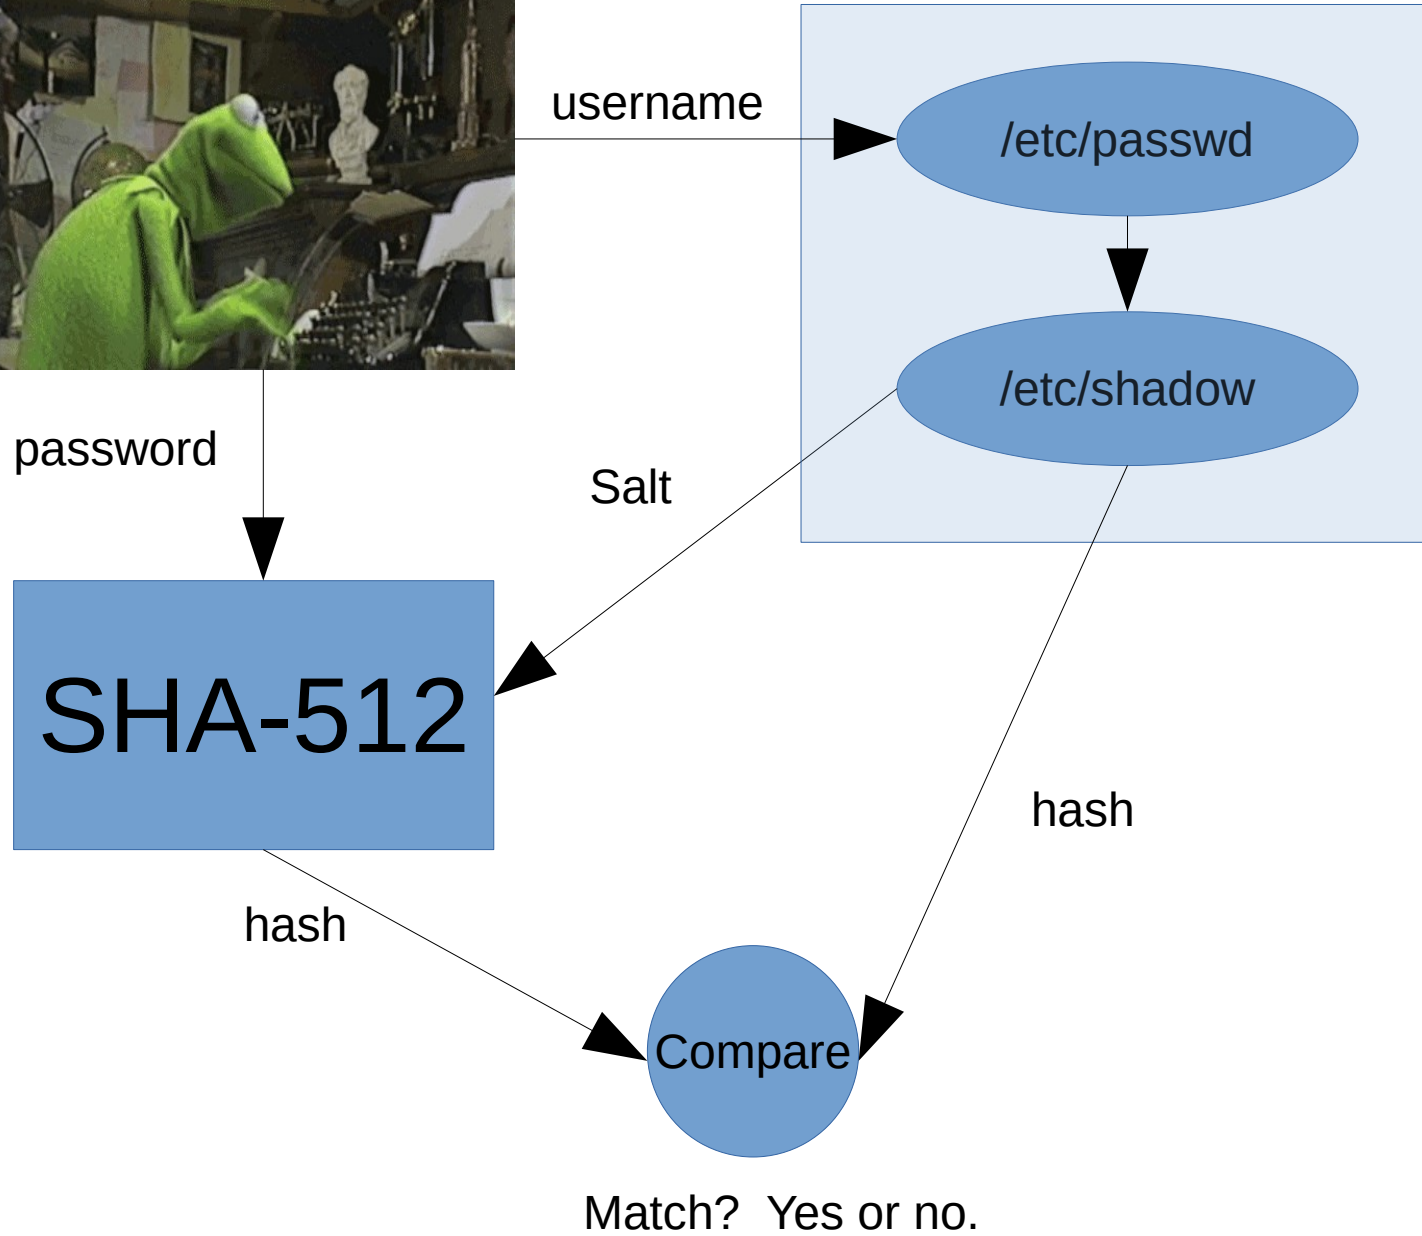

SHA-512

hash

hash

Compare

Match? Yes or no.

Passwords

- Should be high ~~entropy~~, algorithmic complexity
- Should be easy to remember

These requirements are in
conflict with each other!
Password managers help.

Rainbow Table

| | |
|------|----------|
| aaaa | 19330d1d |
| qwer | da09d7dc |

Plagiarized from <https://i.imgsafe.org/2bf87cbfe2.png>

Time-memory tradeoff

- Rainbow tables can store lots of hash results compactly (precomputation)
- Just check if a user's hash might be in a hash chain, only recalculate it if so
- As a fall-back, just try every possible password (brute force)

Salting helps against precomputation.

Good passwords, system-imposed delays, shadowing help against brute force.

Shadowing the password file

```
crandall@hannibal: ~  
crandall@rubicon ~ $ sudo grep "hal" /etc/passwd  
hal:x:1003:1003:Hal,,,:/home/hal:/bin/bash  
crandall@rubicon ~ $ sudo grep "hal" /etc/shadow  
hal:$6$4asLz5vU$l5FDnfwLtlXQf/EESsxI3f3YbjM3fzTtw9EwKy8vsnEU4e8uKIvoy0ST99nquwH5  
QrHwt3SvGsciQk2D980Q9.:17259:0:99999:7:::  
crandall@rubicon ~ $ ls -l /etc/passwd  
-rw-r--r-- 1 root root 2021 Apr  2 22:49 /etc/passwd  
crandall@rubicon ~ $ ls -l /etc/shadow  
-rw-r----- 1 root shadow 1532 Apr  2 22:49 /etc/shadow  
crandall@rubicon ~ $
```

What is a vulnerability?

- Management information stored in-band with regular information?
- Programming the weird machine?
- A failure to properly sanitize inputs?
- Mostly have one of two flavors:
 - One process (can be through local or IPC) sends inputs to another process that trick it into accessing or changing something it shouldn't.
 - A process makes system calls to the kernel and tricks it in some way.

Can be local or remote, sometimes something else

- Send malicious input over a network socket to take control of a remote machine
- Give malicious input to a privileged local process to get escalated privileges for yourself
- Confuse the logic of an accounting mechanism
- Break the separation between web sites in a browser to get access to someone's bank credentials

Plagiarized from
<https://sites.psu.edu/thedeepweb/2015/09/17/captain-crunch-and-his-toy-whistle/>

Other examples of logic bugs or more general vulnerabilities?

- Werewolves had a couple
- Amazon shopping cart (there was an IEEE Symposium on Security and Privacy paper about this, but I can't find it)
- Pouring salt water or putting tabs from construction sites in Coke machines
- Getting a code out of a locked locker
- Other examples you guys know of?

SQL command injection

```
SELECT * where username = '$u' and password = '$p'
```

\$u = **crandall**

\$p = **abc123**

```
SELECT * where username = 'crandall' and password =  
'abc123'
```

SQL command injection

SELECT * where username = '\$u' and password = '\$p'

\$u = bla' or '1' = '1' --
\$p = idontknow

SELECT * where username = 'bla' or '1' = '1' --' and
password = 'idontknow'

SQL command injection

```
SELECT * where username = '$u' and password = '$p'
```

```
$u = bla' or '1' = '1' --  
$p = idontknow
```

```
SELECT * where username = 'bla' or '1' = '1' --' and  
password = 'idontknow'
```

Cross-site Scripting (XSS)

Send a message in the WebCT platform:

Hi Professor Crandall, I had a question about the homework. When is it due? p.s.
<script>alert("youve ben h@xored!")</script>

```
jedi@sugarpine:~$ cat messages.txt
```

```
Hello, how are you?
```

```
I am fine.
```

```
Goodbye.

```

```
:
```

Buffer overflows

A. - Before data is copied.

B. - "hello" is the first command line argument.

C. - "AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA\x08\x35\xC0\x80" is the first command line argument.

Format string vulnerabilities

```
scanf("%s", string)  
printf(string)
```

```
%500x%500x%12x\xbf\xff\xff\x2c%n
```

Memory corruption in general

- Buffer overflows on the stack and heap, format strings, double free()'s, *etc.*
- Easily the most well-studied vulnerability/exploit type
- Goal is often to execute code in memory
- See Shacham's ACM CCS 2007 paper for Return Oriented Programming
 - Even with just existing code in memory, you can build a Turing-complete machine

Race conditions

- Often called Time-of-Check-to-Time-of-Use (TOCTTOU)

```
if (!access("/home/jedi/s", W_OK))
{
    F = open("/home/jedi/s", O_WRITE);
    ... /* Write to the file */
}
else
{
    perror("You don't have permission to write to that file!")
}
```

Werewolves race condition

```
touch moderatoronlylogfile.txt  
chmod og-rw moderatoronlylogfile.txt
```

Phishing

From: "Dropbox Notification" <dropbox.noreplay@gmail.com>
Date: Dec 7, 2016 [REDACTED]
Subject: You have 1 new file in your inbox
To: [REDACTED]
Cc:

Hi [REDACTED]

You have received a new document in your inbox, view the file "مذكرة القبض على عزة سليمان.pdf" on Dropbox.

[View file](#)

Image plagiarized from <https://citizenlab.org/wp-content/uploads/2017/02/Ponytail-Figure-1.png>

Phishing

- Wide range of sophistication in terms of the social engineering aspect
 - One end of the spectrum: “Plez logg in and changer you password, maam!”
 - Other end of the spectrum: “The attached PDF is my notes from the meeting yesterday, it was nice to see you again!” (from someone you saw at a conference the day before)

2FA helps protect against phishing
(but state actors can easily spoof your
cell phone and get SMS messages)

Coming up...

- Covert channels, where processes communicate through channels not intended for communication
 - Assumes collusion
- Side channels, where the sending process doesn't mean to be sending
- File permissions are checked when the file is opened (and added to the file descriptor table of the process), not with every access!

man ...

- ls (ls -l is a useful flag), cd, pwd, chown, chgrp, chmod, stat, id, w, who, last, kill, ps, pstree, netstat, cat, less, sudo, watch, screen, fuser

Some more things to read up on

- FIFO pipes (can be unnamed or named)
- The `/proc/` filesystem
- Character devices (*e.g.*, PTY, PTS, TTY)

Resources

- <http://www.cs.unm.edu/~crandall/linuxcommandcheatsheet.txt>
- Matt Bishop's *Computer Security: Art and Practice*, Chapter 12
